

## BODY SHOP REPAINT REQUIREMENTS

The following Items are required to be undertaken by a bodyshop when repainting the car to ensure the minimisation of risk to the respray during fitting and removal film

1. Must use a two pack clear coat single pack clear coats can interact with the alcohol used in the fitting process.
2. Must be Oven baked this is to ensure that we have the hardest possible surface to work on to minimise the risk of minor surface scratches.
3. Must be fully primed and keyed the latter point is essential to eliminate (to all practical purposes) the potential risk of paint pull should the film need to be removed at some future date whilst we cannot exclude this in its entirety we know that where this is correctly done the risk of this occurrence is as close to zero as to be statistically insignificant.
4. 7 Clear days must elapse from painting before work can be undertaken by us this is to ensure that any residual gassing out has ended thus alleviating the risk of bubbles forming under the film
